HETEROCYCLIC ANTI-MIGRAINE AGENTS

5

FIELD OF THE INVENTION

The present invention relates to novel small molecule antagonists of calcitonin gene-related peptide receptors ("CGRP-receptor"), pharmaceutical
10 compositions comprising them, methods for identifying them, methods of treatment using them and their use in therapy for treatment of neurogenic vasodilation, neurogenic inflammation, migraine, cluster headache and other headaches, thermal injury, circulatory shock, flushing associated with menopause, airway inflammatory diseases, such as asthma and chronic obstructive pulmonary
15 disease (COPD), and other conditions the treatment of which can be effected by the antagonism of CGRP-receptors.

BACKGROUND OF THE INVENTION

Calcitonin gene-related peptide (CGRP) is a naturally occurring 37-
20 amino-acid peptide first identified in 1982 (Amara, S. G. et al, *Science* **1982**, 298, 240-244). Two forms of the peptide are expressed (α CGRP and β CGRP) which differ by one and three amino acids in rats and humans, respectively. The peptide is widely distributed in both the peripheral (PNS) and central nervous system (CNS), principally localized in sensory afferent and central neurons, and displays
25 a number of biological effects, including vasodilation.

When released from the cell, CGRP binds to specific cell surface G protein-coupled receptors and exerts its biological action predominantly by activation of intracellular adenylate cyclase (Poyner, D. R. et al, *Br J Pharmacol* **1992**, *105*, 441-7; Van Valen, F. et al, *Neurosci Lett* **1990**, *119*, 195-8.). Two
30 classes of CGRP receptors, CGRP₁ and CGRP₂, have been proposed based on the antagonist properties of the peptide fragment CGRP(8-37) and the ability of

linear analogues of CGRP to activate CGRP₂ receptors (Juaneda, C. et al. *TiPS* 2000, 21, 432-438). However, there is lack of molecular evidence for the CGRP₂ receptor (Brain, S. D. et al, *TiPS* 2002, 23, 51-53). The CGRP₁ receptor has three components: (i) a 7 transmembrane calcitonin receptor-like receptor (CRLR); (ii) 5 the single transmembrane receptor activity modifying protein type one (RAMP1); and (iii) the intracellular receptor component protein (RCP) (Evans B. N. et al., *J Biol Chem.* 2000, 275, 31438-43). RAMP1 is required for transport of CRLR to the plasma membrane and for ligand binding to the CGRP-receptor (McLatchie, L. M. et al, *Nature* 1998, 393, 333-339). RCP is required for signal transduction 10 (Evans B. N. et al., *J Biol Chem.* 2000, 275, 31438-43). There are known species-specific differences in binding of small molecule antagonists to the CGRP-receptor with typically greater affinity seen for antagonism of the human receptor than for other species (Brain, S. D. et al, *TiPS* 2002, 23, 51-53). The amino acid sequence of RAMP1 determines the species selectivity, in particular, the amino 15 acid residue Trp74 is responsible for the phenotype of the human receptor (Mallee et al. *J Biol Chem* 2002, 277, 14294-8).

Inhibitors at the receptor level to CGRP are postulated to be useful in pathophysiologic conditions where excessive CGRP receptor activation has occurred. Some of these include neurogenic vasodilation, neurogenic 20 inflammation, migraine, cluster headache and other headaches, thermal injury, circulatory shock, menopausal flushing, and asthma. CGRP receptor activation has been implicated in the pathogenesis of migraine headache (Edvinsson L. *CNS Drugs* 2001;15(10):745-53; Williamson, D. J. *Microsc. Res. Tech.* 2001, 53, 167-178.; Grant, A. D. *Brit. J. Pharmacol.* 2002, 135, 356-362.). Serum levels of 25 CGRP are elevated during migraine (Goadsby PJ, et al. *Ann Neurol* 1990;28:183-7) and treatment with anti-migraine drugs returns CGRP levels to normal coincident with alleviation of headache (Gallai V. et al. *Cephalalgia* 1995;15: 384-90). Migraineurs exhibit elevated basal CGRP levels compared to controls (Ashina M, et al., *Pain.* 2000;86(1-2):133-8.2000). Intravenous CGRP infusion 30 produces lasting headache in migraineurs (Lassen LH, et al. *Cephalalgia.* 2002 Feb;22(1):54-61). Preclinical studies in dog and rat report that systemic CGRP

blockade with the peptide antagonist CGRP(8-37) does not alter resting systemic hemodynamics nor regional blood flow (Shen, Y-T. et al, *J Pharmacol Exp Ther* **2001**, 298, 551-8). Thus, CGRP-receptor antagonists may present a novel treatment for migraine that avoids the cardiovascular liabilities of active
5 vasoconstriction associated with non-selective 5-HT_{1B/1D} agonists, 'triptans' (e.g., sumatriptan). See Olesen, et al., *New England Journal of Medicine*, **2004**, 350 (11), 1104-1110.

A number of non-peptidic, small molecule CGRP-receptor antagonists have been recently reported. WO 97/09046 and equivalents disclose *inter alia*
10 quinine and quinidine related compounds which are ligands, in particular antagonists, of CGRP-receptor. WO 98/09630 and WO 98/56779 and equivalents disclose *inter alia* variously substituted, nitrobenzamide compounds as CGRP-receptor antagonists. 15 cyclopropane derivatives as CGRP-receptor antagonists. WO 00/18764, WO 98/11128 and WO 00/55154 and equivalents disclose *inter alia* benzimidazoliny piperidines as antagonists to CGRP-receptor. Unrelated to CGRP, a series of somatostatin antagonists have been disclosed in WO 99/52875 and WO 01/25228 and equivalents. See also US 6,344,449, US 6,313,097, US 6,521,609, US

Other embodiments of the present invention may comprise a suitable combination of two or more of the embodiments and/or aspects disclosed herein.

Yet other embodiments of the present invention may comprise a suitable subset of an embodiment and/or aspect disclosed herein.

5 Still yet other embodiments and aspects of the invention will be apparent according to the description provided below.

DETAILED DESCRIPTION OF THE INVENTION

The description of the invention herein should be construed in congruity
10 with the laws and principals of chemical bonding. For example, it may be necessary to remove a hydrogen atom in order accommodate a substituent at any given location.

As used herein, "heterocyclic" or "heterocycle" includes cyclic moieties containing one or more heteroatoms, (*e.g.*, O, N or S) said heterocycles include
15 those that are aromatic and those that are not, *i.e.*, "alicyclic", unless otherwise specified.

As used herein, the term "fused bicyclic system" when describing for example a 5.6-fused bicyclic system containing 1 to 4 nitrogen atoms includes aromatic and alicyclic systems, *e.g.* indolizine, indole, isoindole, 3H-indole,
20 indoline, indazole or benzimidazole.

If a substituent is named generically, then any and all species of that genus comprise that aspect of the invention. For example, a substituent generically named as "pyrrolonyl" (the radical of "pyrrolone", a pyrrole having a carbonyl) includes pyrrol-2-onyls wherein the carbonyl is adjacent to the nitrogen
25 and pyrrol-3-onyls wherein the carbonyl and nitrogen have an intervening methylene.

Similarly, the present invention comprises that a substituent may be attached at any and all suitable points of attachment on said substituent unless otherwise specified.

30 However, it is also understood that the compounds encompassed by the present invention are those that are chemically stable, *i.e.*, heteroalicyclic

substituents of the present invention should not be attached in such a way that a heteroatom in said heteroalicyclic substituent is alpha to a point of attachment wherein said point of attachment is also a heteroatom.

5 An embodiment or aspect which depends from another embodiment or aspect, will describe only the variables having values or provisos that differ from the embodiment or aspect from which it depends. If for example a dependent embodiment only addresses R^2 , then the variables and provisos not related to R^2 should reflect that of the embodiment from which it depends.

10 If a variable is quantified with a value of zero, then a bond attaching said variable should no longer be represented.

As used herein, "alkylene" means a divalent alkane, *i.e.*, an alkane having two hydrogen atoms removed from said alkane (said hydrogen removed from two different carbon atoms when said alkane contains more than one carbon atom), *e.g.*, $-\text{CH}_2\text{CH}_2\text{CH}_2-$.

15 As used herein, "alkylidene" means an alkane having two hydrogen atoms removed from one carbon atom in said alkane, *e.g.*,

20 It should be understood that the alternating double bond designations in the six-membered ring of the 5,6-membered fused structure represented in Formula (I) are relative and represent the delocalized π orbital electrons of said ring.

As used herein, "aryl" or "ar-" includes phenyl or naphthyl.

As used herein, "heterocyclic" or "heterocyclo" includes both heteroaryl and heteroalicyclic.

25 As used herein, "halo" or "halogen" includes fluoro, chloro, bromo and iodo and further means one or more of the same or different halogens may be substituted on a respective moiety.

Unless specified otherwise, acyclic hydrocarbons such as alkyl, alkoxy, alkenyl and alkynyl may be branched or straight chained.

It is to be understood that the present invention may include any and all possible stereoisomers, geometric isomers, diastereoisomers, enantiomers, anomers and optical isomers, unless a particular description specifies otherwise.

The compounds of this invention may exist in the form of

5 pharmaceutically acceptable salts. Such salts may include addition salts with inorganic acids such as, for example, hydrochloric acid and sulfuric acid, and with organic acids such as, for example, acetic acid, citric acid, methanesulfonic acid, toluenesulfonic acid, tartaric acid and maleic acid. Further, in case the compounds of this invention contain an acidic group, the acidic group may exist

10 in the form of alkali metal salts such as, for example, a potassium salt and a sodium salt; alkaline earth metal salts such as, for example, a magnesium salt and a calcium salt; and salts with organic bases such as a triethylammonium salt and an arginine salt. In the case of a sublingual formulation a saccharin salt or maleate salt may be of particular benefit. The compounds of the present invention

15 may be hydrated or non-hydrated.

The compounds of this invention can be administered in such oral dosage forms as tablets, capsules (each of which includes sustained release or timed release formulations), pills, powders, granules, elixirs, tinctures, suspensions, syrups and emulsions. The compounds of this invention may also be

20 administered intravenously, intraperitoneally, subcutaneously, or intramuscularly, all using dosage forms well known to those skilled in the pharmaceutical arts. The compounds can be administered alone, but generally will be administered with a pharmaceutical carrier selected upon the basis of the chosen route of administration and standard pharmaceutical practice. Compounds of this

25 invention can also be administered in intranasal form by topical use of suitable intranasal vehicles, or by transdermal routes, using transdermal skin patches. When compounds of this invention are administered transdermally the dosage will be continuous throughout the dosage regimen.

While dosing from 0.01 mg/kg to 30 mg/kg is envisaged for compounds

30 of the present invention, the dosage and dosage regimen and scheduling of a compounds of the present invention must in each case be carefully adjusted,

utilizing sound professional judgment and considering the age, weight and condition of the recipient, the route of administration and the nature and extent of the disease condition. In accordance with good clinical practice, it is preferred to administer the instant compounds at a concentration level which will produce effective beneficial effects without causing any harmful or untoward side effects.

SYNTHESIS

I

Compounds of the present invention may be synthesized according to the general schemes provided below. Variables provided in the schemes are defined in accordance with the description of compounds of Formula (I) in the first aspect of the invention unless otherwise specified. It may also be possible to use variations of said schemes to prepare the compounds of the present inventions, said variations discernible to those skilled in the art.

The compounds of the present invention may be prepared according to Scheme 1.

Scheme 1. Synthesis of Formula I Compounds

Representative V-Metal:

The synthesis described in Scheme I begins with commercially available or synthesized aldehydes. The three-carbon homologation and the conjugated double-bond formation with two consecutive Wittig reactions are well-known in the literature leading to compounds of Formula V. Some Formula V compounds

are also commercially available and can be prepared by other literature methods. The group V can be any carbon (C) or nitrogen (N) based nucleophile that can add to the double bond in a process known as 1,4-Michael addition leading to compounds of Formula VI. Nitrogen based nucleophiles usually undergo the
 5 desired 1,4-addition. For carbon based nucleophiles, known modifications using copper salts usually favor the desired 1,4-addition. Aryl boronic acid or organosiloxane can be added to the desired beta-position through rhodium catalysis and asymmetric synthesis through chiral ligands is also known (*JOC*,
 2000, 65, 5951-5955; *Tetrahedron Asymmetry* 1999, 10, 4047-4056; *JACS* 1998,
 10 120, 5579-5580; *Org.Lett.* 2002, 4, 667-669). Hydrolysis of compounds of Formula VI leads to Formula VII, free carboxylic acids, which react with amines to afford Formula I compounds.

Oxadiazole-containing compounds of Formula I may be prepared according to Scheme 2.

15

Scheme 2. Synthesis of Formula I Compounds

Treatment of N-hydroxyamidines with bases such as sodium hydride
 20 followed by addition of esters of Formula VIII and heating give [1,2,4]oxadiazoles of Formula I, after heating.

Tetrazole-containing compounds of Formula I may be prepared according to Scheme 3.

Scheme 3. Synthesis of Formula I Compounds

- Esters of Formula VIII can be hydrolyzed to the corresponding carboxylic acids using either acids or bases, controlling conditions to spare other functionality. Acids of Formula IX can be converted to the primary amides of Formula X by simple coupling with ammonia using various amide coupling agents well known in the art. Nitriles of Formula XI are available from the amides by dehydration using agents such as trifluoroacetic anhydride. These are converted to the corresponding tetrazoles of Formula I (where $\text{R}^4 = \text{H}$) by treatment with azidotrimethyltin. Deprotonation of these compounds with bases such as sodium hydride, followed by alkylation with various agents such as alkyl halides and alkyl sulfonates gives further compounds of Formula I that are substituted on the tetrazole ring.
- Compounds of Formula VIII in which $\text{X} = \text{CH}_2$ can be prepared according to Scheme 4.

Scheme 4. Synthesis of Formula VIII Compounds

Scheme 4 starts with commercially available or synthesized aldehydes.

- 5 These are reacted with dimethyl succinate in the presence of bases to give compounds of Formula XIII. The double bond of the Formula XIII compound is reduced to give compounds of Formula XIV. Reduction can be carried out to give either a racemate or by use of a stereoselective catalyst to give either enantiomer of Formula XIV. Such reductions can result from transfer
- 10 hydrogenation from hydrogen donors such as formic acid or cyclohexadiene, or hydrogenation using gaseous hydrogen, both in the presence of a suitable catalyst. Amide coupling with amines of Formula XV leads to compounds of Formula VIII using well known amide synthesis protocols.

- 15 Compounds of Formula XX and XXI in which $X = O$ or NH can be prepared according to Scheme 5.

Scheme 5. Synthesis of Formula XX and XXI Compounds

- Scheme 5 starts with commercially available or synthesized aldehydes of
- 5 Formula XII. These are reacted in the presence of a base with phosphonates of Formula XVI where PG is a protecting group such as acetyl, benzoyl, benzyloxycarbonyl, tert-butoxycarbonyl, a trisubstituted silyl, or another appropriate protecting group. Compound XVI need not be the trimethyl phosphonoacetate. The methyl groups of XVI may be exchanged with other alkyl
- 10 groups such as ethyl, t-butyl, benzyl groups, or combinations thereof. Such modifications are familiar to those with ordinary skill in the art. In some cases, there exists functionality on R^3 that requires protection with an appropriate protecting group such that subsequent chemistry can proceed as described. The use of such protecting groups is also well known to those of ordinary skill in the
- 15 art. The double bond of the Formula XVII compound is reduced to give compounds of Formula XVIII. Reduction can be carried out to give either a racemate or by use of a stereoselective catalyst to give either enantiomer of Formula XVIII. Such reductions can result from transfer hydrogenation from hydrogen donors such as formic acid or cyclohexadiene, or hydrogenation using

gaseous hydrogen, both in the presence of a suitable catalyst. Deprotection of the protecting group (PG) under standard deprotection protocols affords Formula XXI compounds. In some cases, removal of the protecting group gives rise to concomitant hydrolysis of the methyl ester to give compounds of Formula XX.

- 5 The carboxylic acids can be protected to give Formula XXI compounds by treatment with diazomethane or another suitable alkylating agent. Alternately, esters of Formula XVIII can be hydrolyzed to the corresponding carboxylic acids of Formula XIX, using either acids or bases, controlling reaction conditions to spare other functional groups.

- 10 Compounds of Formula VIII can be prepared according to Scheme 6.

Scheme 6. Synthesis of Formula VIII Compounds

- 15 The synthesis described by Scheme 6 begins with a compound of Formula XXI, which is an amino acid (where X = NH) or a hydroxy acid (where X = O) with a protected carboxylate terminus. The protecting group is generally a methyl ester, but other protecting groups such as ethyl, t-butyl, and benzyl esters may also be used. The Formula XXI compound is coupled with an amine of
- 20 Formula XV in a mixed urea or urea isostere reaction, as above, to generate a Formula VIII compound. This can involve activation of either Compound XXI or XV with a reagent such as carbonyl diimidazole or p-nitrophenylchloroformate, giving an intermediate that is activated toward nucleophilic addition, and treating that intermediate with Compound XXI or XV in the presence of a base, if
- 25 necessary.

Imidazole-containing compounds of Formula I can be prepared according to Scheme 7.

Scheme 7. Synthesis of Formula I Compounds

- The synthesis described by Scheme 7 begins with an ester of Formula VIII. The ester may be reduced directly to an aldehyde of Formula XXIII using diisobutylaluminum hydride or other appropriate reducing agent. Alternately, compounds of Formula VIII can be reduced to an alcohol of Formula XXII by using lithium borohydride or another appropriate reducing agent. Alcohols of Formula XXII are oxidized to aldehydes of Formula XXIII by treatment with an appropriate oxidant. Such oxidations and reductions are well known to those skilled in the art. Aldehydes of Formula XXIII are condensed with dicarbonyl compounds of Formula XXIV in the presence of ammonia to afford *N*-unsubstituted imidazoles ($\text{R}^7 = \text{H}$) of Formula I. These Formula I compounds can be further derivatized by alkylation with appropriate electrophiles such as alkyl halides or alkyl sulfonates in the presence of a base or aryl halides in the presence of a base and an appropriate catalyst to give Formula I compounds where R^7 is not H. In cases where a protecting group is employed on the group R^3 , deprotection conditions appropriate to the protecting group and compatible with the rest of the molecule can be employed to remove it. Such protecting group manipulations are well known to those skilled in the art.

Imidazole-containing compounds of Formula I can also be prepared according to Scheme 8.

Scheme 8. Synthesis of Formula I Compounds

5

Scheme 8 begins with reduction of a methyl ester of Formula XVIII to an alcohol of Formula XXV using an appropriate reducing reagent such as lithium borohydride. The resulting alcohol can then be oxidized to an aldehyde of Formula XXVI by treatment with an appropriate oxidant. In some cases it is possible to reduce compounds of Formula XVIII directly to compounds of Formula XXVI by use of diisobutylaluminum hydride or another appropriate reducing agent. Such oxidations and reductions are well known to those skilled in the art. The Formula XXVI aldehyde can be condensed with a Formula XXIV dicarbonyl compound to afford an *N*-unsubstituted ($\text{R}^7 = \text{H}$) imidazole of Formula XXVII. In some cases, it is desirable to alkylate the imidazole with an appropriate electrophilic reagent such as alkyl halides or alkyl sulfonates in the presence of a base, or aryl halides in the presence of a base and an appropriate catalyst to afford substituted imidazoles of Formula XXVII where R^7 is not H.

The protecting group (PG) can then be removed to liberate the hydroxyl group (when X = O) or the primary amine (when X = NH) by application of deprotection conditions appropriate to the protecting group. Such deprotections are well known in the art. Compounds of Formula XXVIII are coupled with an amine of Formula XV in the presence of phosgene or a phosgene equivalent to generate a urethane (when X = O) or mixed urea (when X = NH) of Formula I. Compounds of Formula XXVIII can also be used in a urea isostere reaction, as above, to generate a Formula I compound. Where protecting groups have been utilized on the group Q, they are removed by conditions appropriate to the protecting group and compatible with the rest of the molecule.

Tetrazole-containing compounds of Formula I may also be prepared according to Scheme 9.

Scheme 9. Synthesis of Formula I Compounds

15

Scheme 9 begins with the coupling of a carboxylic acid of Formula XIX to a primary amine to give secondary amides of Formula XXIX using various amide coupling agents well known in the art. Conversion of Formula XXIX amides to tetrazoles of Formula XXX can be accomplished by treatment with a

dehydrating agent such as phosphorous pentachloride or phosphorous oxychloride followed by treatment with an azide source such as tributyltin azide. The protecting group (PG) can then be removed to liberate the hydroxyl group (when $X = O$) or the primary amine (when $X = NH$) by application of

5 deprotection conditions appropriate to the protecting group. Such deprotections are well known in the art. Resulting compounds of Formula XXXI can be coupled with an amine of Formula XV in the presence of phosgene or a phosgene equivalent to generate a urethane (when $X = O$) or mixed urea (when $X = NH$) of Formula I. Compounds of Formula XXXI can also be used in a urea isostere

10 reaction, as above, to generate Formula I compounds. Where protecting groups have been utilized on Q, they are removed by conditions which are appropriate to the protecting group.

Compounds of Formula I may also be prepared according to Scheme 10.

15

Scheme 10. Synthesis of Formula I Compounds

Scheme 10 begins with the coupling of a carboxylic acid of Formula XIX to a compound of Formula XXXII to give secondary amides of Formula XXXIII using various amide coupling agents well known in the art. The pyridinyl-amide

20

of Formula XXXIII can be made to undergo cyclization to give heterocycles of Formula XXXIV by use of a dehydrating agent such as phosphorous pentachloride or phosphorous oxychloride either alone or in the presence of an amine base such as pyridine or quinoline. The protecting group (PG) can then be removed to liberate the hydroxyl group (when X = O) or the primary amine (when X = NH) by application of deprotection conditions appropriate to the protecting group. Such deprotections are well known in the art. Compounds of Formula XXXV are coupled with an amine of Formula XV in the presence of phosgene or a phosgene equivalent to generate a urethane (when X = O) or mixed urea (when X = NH) of Formula I. Compounds of Formula XXXV can also be used in a urea isostere reaction, as above, to generate Formula I compounds. Where protecting groups have been utilized on Q, they are removed by conditions which are appropriate to the protecting group and compatible with the rest of the molecule.

Compounds of Formula I may also be prepared according to Scheme 11.

Scheme 11. Synthesis of Formula I Compounds

The general synthesis described in Scheme 11 begins with commercially
 5 available or synthesized aldehydes of Formula XXXVI. Conversion of Formula
 XXXVI aldehydes to α -aminophosphonates XXXVII and the following Wittig
 reactions with other commercially available or synthesized aldehydes of Formula
 XII followed by acidic hydrolysis afford ketones of Formula XXXVIII
 (*Tetrahedron Lett.* **1998**, 39, 1717-1720). The ketones of Formula XXXVIII
 10 can be conveniently reduced to the corresponding alcohols XXXIX. Completion

- of the synthesis of Formula I compounds with $X = O$ can be achieved through formation of activated intermediates such as p-nitrophenyl or N-succinimidyl carbonates followed by coupling with amines of Formula XV. On the other hand, alcohols of Formula XXXIX can also be converted to phthalimides XL using
- 5 Mitsunobu conditions that are well known in the art. Treatment of Formula XL compounds with hydrazine affords amines XLI which can be further converted to compounds of Formula I with $X = NH$ through activation with carbonyl diimidazole or similar activating agents. Furthermore, the ketones of Formula XXXVIII can be converted to esters of Formula XLII using Wittig conditions.
- 10 Reduction of the double bond affords compounds of Formula VI. Hydrolysis of Formula VI esters leads to carboxylic acids of Formula VII which can be coupled with amines of formula XV to afford Formula I compounds with $X = CH_2$ using amide coupling agents well known in the art. Furthermore, Formula I compounds can be further expanded to other Formula I compounds if the aldehydes of
- 15 Formula XXXVI contain suitable functional groups that can be modified using general synthetic methods known in the art.

Imidazole-containing compounds of Formula I may also be prepared as shown in Scheme 12.

Scheme 12. Synthesis of Formula I Compounds

- The synthesis begins with succinyl monoesters XIV from Scheme 4. The
- 5 free carboxyl group can be protected with various blocking groups (PG) such as tert-butyl, using methods well known in the art, to give diesters XLIV. The methyl ester can be selectively hydrolyzed using mild basic conditions and the resulting carboxyl group reduced to the corresponding aldehydes XLV. This can be accomplished either by direct reduction of the ester using a selective hydride
- 10 source such as diisobutylaluminum hydride or by reduction of the carboxyl group first to the corresponding alcohol, through an activated ester, and then oxidation to the aldehyde using, for example, Dess-Martin protocols. There are numerous alternative methods for these transformations well known to those skilled in the art. Aldehydes XLV can be converted to substituted or unsubstituted imidazoles
- 15 of Formula XLVI by heating with glyoxal or other suitable dicarbonyl

compounds of Formula XXIV such as pyruvic aldehyde in the presence of ammonia in a polar, non-nucleophilic solvent such as dioxane. The imidazole ring can be further functionalized by alkylation of one of the nitrogen atoms with a suitable electrophile, such as an alkyl halide, in the presence of a base in a non-nucleophilic solvent to give *N*-substituted derivatives XLVII. Removal of the ester protecting group (PG) and amide coupling gives imidazole-containing compounds of Formula I.

Compounds of Formula XVII where X = NH, and where R³ is an aromatic ring, can also be prepared as shown in Scheme 13.

Scheme 13. Synthesis of Formula XVII Compounds where X = NH

Scheme 13 starts with an *N*-protected aminoacrylate of Formula XLVIII that can be coupled to a compound of Formula XLIX comprising an aromatic ring to which is attached a leaving group such as iodine or bromine in the presence of a transition metal catalyst such as palladium (II) acetate in a non-reactive solvent with or without heating.

5 (±)-Ethyl 3-(4-ethylpyridin-2-yl)-4-(7-methyl-2-((2-(trimethylsilyl)ethoxy)methyl)-2H-indazol-5-yl)butanoate

To a solution of 2-bromo-4-ethylpyridine (310 mg, 1.665 mmol, 4.4 equiv) in anhydrous ether (1.2 mL) at -70°C in an oven-dried flask was added n-butyllithium (2.5 M, 0.67 mL, 1.66 mmol, 4.4 equiv) dropwise under nitrogen via syringe. The resulting deep-red solution was stirred for 5 min before use in the next step.

Anhydrous ether (1.2 mL) was added and the suspension was cooled to 0°C before the solution of 2-pyridinyl lithium was added via cannula. A yellowish brown precipitate was formed. After stirring at 0°C for 20 min, the cooling bath was removed and ethyl 4-(7-methyl-2-((2-(trimethylsilyl)ethoxy)methyl)-2H-indazol-5-yl)but-2-enoate (141.7 mg, 0.378 mmol, 1.0 equiv.) in anhydrous ether (1.2 mL) was added via syringe. The solution was stirred at room temperature for 1 h. The layers were separated and the organic layer was washed with water, brine, dried over sodium sulfate and concentrated *in vacuo*. Flash column chromatography (5% methanol in methylene chloride) afforded the desired product (80 mg, 44 %) which was carried on without farther purification. MS (ESI) 482 (MH) $^{+}$.

 mmol) and *N*-methyl-dicyclohexylamine (23.6 mL, 110 mmol) in tetrahydrofuran
 20 (200 mL) at 0°C was added chloromethyl methyl ether (7.50 mL, 1.8 equiv). The
 reaction was allowed to gradually warm to room temperature overnight. The
 reaction was concentrated, dissolved in diethyl ether, washed with water, then 1
 M hydrochloric acid, then water, then brine, dried over magnesium sulfate, and
 concentrated to give an oil. The oil was dissolved in ethyl acetate and treated
 25 with hexanes until lasting turbidity. The suspension was heated until a clear
 solution was obtained and the flask placed in the freezer. The resulting
 crystalline solid was crushed with a spatula to break it up, reheated to dissolve
 some of the solids, and placed in the freezer. The solids were filtered, washed

with very cold ether (-78°C), and air-dried to give 5.43 g. The mother liquor was concentrated, redissolved in ca. 20 mL ether, cooled to -78°C, and treated with a seed crystal of the product. After 1 h, the resulting solids were filtered, washed with cold ether (-78°C), and air-dried to give an additional 1.05 g (total yield =

To a flame dried three neck round bottom flask, was added methyl 2-(benzyloxycarbonyl)-3-hydroxypropanoate (129 g, 509 mmol), anhydrous methylene chloride (2 L), and methanesulfonyl chloride (49.3 mL, 636 mmol). The mixture was cooled to -15°C → 20°C for 20 min while stirring with a
 20 mechanical stirrer. Triethylamine (213 mL, 1527 mmol) was added dropwise ensuring the inner temperature of the reaction mixture did not exceed 0°C (the addition of the first equivalent of triethylamine was exothermic). After the addition of triethylamine, the mixture was stirred at 0°C for 30 min, then the cooling bath was removed and the mixture was stirred at room temperature for
 25 1.5 h. Methanol (21 mL) was added to quench excess methanesulfonyl chloride.

The mixture was washed portionwise with 0.5% aq. potassium hydrogen sulfate to pH 5, then sat. sodium bicarbonate/brine (1:2 by volume) and brine. The methylene chloride solution was dried over anhydrous sodium sulfate. After filtration, the solvents were removed and the residue was subjected to column chromatography on silica gel using 1:9 ethyl acetate/hexanes as eluent to afford the title compound as a colorless very viscous oil, which recrystallized upon standing at room temperature, 0°C and -15°C (111 g, 92% yield). ¹H-NMR (DMSO-d₆) δ 8.96 (s, 1H), 7.39 – 7.35 (m, 5H), 5.76 (s, 1H), 5.60 (s, 1H), 5.10 (s, 2H), 3.71 (s, 3H); ¹³C-NMR (DMSO-d₆) δ 163.7, 153.5, 136.3, 133.3, 128.8, 128.3, 128.1, 127.8, 65.9, 52.3.

(Z)-Methyl 3-(4-amino-3,5-dimethylphenyl)-2-(benzyloxycarbonyl)acrylate

A 2 L round bottom flask, was charged with 4-iodo-2,6-dimethylbenzenamine hydrochloride salt (55 g, 194 mmol), methyl 2-(benzyloxycarbonyl)acrylate (59.2 g, 252 mmol), tetrabutylammonium chloride (59.2 g, 213 mmol), palladium acetate (4.34 g, 19.4 mmol), and tetrahydrofuran (1.2 L, degassed by a flow of nitrogen for 30 min). The mixture was stirred to form a suspension and degassed by a flow of nitrogen for 30 min. Triethylamine (110 mL, 789 mmol) was then added and the resulting mixture was heated at reflux for 3h. After cooling to room temperature, the reaction mixture was filtered through a pad of celite and washed twice with tetrahydrofuran (2 × 100 mL). The solvents were removed and the residue was dissolved in methylene chloride which was extracted with water (3X), brine (2X), dried over sodium sulfate and concentrated. Column chromatography on silica gel using 1:9 ethyl acetate/methylene chloride as eluent afforded a tan solid, which was recrystallized from methanol (210 mL) and water (100 mL). After filtration, the solid was washed with ice cold 1:1 methanol/water mixture and then dried under high vacuum overnight at room temperature to afford the title compound (58.0 g,

65%) as a light tan solid. NMR shows a 2.7:1 ratio of Z and E isomers which were not separated. ¹H-NMR (DMSO-d₆) δ 8.79 (s, 0.73H), 8.51 (s, 0.27 H), 7.40 – 7.21 (m, 8H), 5.24 (s, 2H), 5.13 (s, 1.46 H), 5.00 (s, 0.54 H), 3.68 (s, 2.2 H), 3.61 (s, 0.8 H), 2.05 (s, 6H); ¹³C-NMR (DMSO-d₆) δ 166.0, 154.7, 146.9,

CGRP Binding Assay

Tissue Culture. SK-N-MC cells were grown at 37 °C in 5% CO₂ as a monolayer in medium consisting of MEM with Earle's salts and L-glutamine (Gibco) supplemented with 10% fetal bovine serum (Gibco).

5

Cell Pellets. The cells were rinsed twice with phosphate-buffered saline (155 mM NaCl, 3.3 mM Na₂HPO₄, 1.1 mM KH₂PO₄, pH 7.4), and incubated for 5-10 min. at 4 °C in hypotonic lysis buffer consisting of 10 mM Tris (pH 7.4) and 5 mM EDTA. The cells were transferred from plates to polypropylene tubes (16 x 100 mm) and homogenized using a polytron. Homogenates were centrifuged at 32,000 x g for 30 min. The pellets were resuspended in cold hypotonic lysis buffer with 0.1% mammalian protease inhibitor cocktail (Sigma) and assayed for protein concentration. The SK-N-MC homogenate was then aliquoted and stored at -80 °C until needed.

15

Radioligand Binding Assay. The compounds of invention were solubilized and carried through serial dilutions using 100% DMSO. Aliquots from the compound serial dilutions were further diluted 25 fold into assay buffer (50 mM Tris-Cl pH 7.5, 5 mM MgCl₂, 0.005% Triton X-100) and transferred (volume 50 µl) into 96 well assay plates. [¹²⁵I]-CGRP (Amersham Biosciences) was diluted to 60 pM in assay buffer and a volume of 50 µl was added to each well. SK-N-MC pellets were thawed, diluted in assay buffer with fresh 0.1% mammalian protease inhibitor cocktail (Sigma), and homogenized again. SK-N-MC homogenate (5 µg/well) was added in a volume of 100 µl. The assay plates were then incubated at room temperature for 2 h. Assays were stopped by addition of excess cold wash buffer (20 mM Tris-Cl pH 7.5, 0.1% BSA) immediately followed by filtration over glass fiber filters (Whatman GF/B) previously soaked in 0.5% PEI. Non-specific binding was defined with 1 µM beta-CGRP. Protein bound radioactivity was determined using a gamma or scintillation counter. The IC₅₀ was defined as the concentration of a compound of invention required to displace 50% of radioligand binding.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US2004/040721

Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

Although claim 43 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/SA/ 210

Continuation of Box II.1

Although claim 43 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

The applicant's attention is drawn to the fact that claims relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure. If the application proceeds into the regional phase before the EPO, the applicant is reminded that a search may be carried out during examination before the EPO (see EPO Guideline C-VI, 8.5), should the problems which led to the Article 17(2) declaration be overcome.
